

Tilt trailers to quickly and safely unload potatoes, fruits and vegetables.

Reduce product damage and labour costs by using gravity to unload tractors with trailers up to 22 metres long.

Single hinge design safely lifts trailers to empty product into a stationary transfer conveyor or flume system.

Less product damage

With the trailer tilted to a 45° angle, product empties by gravity, eliminating damage and labour costs incurred by traditional mechanical and manual unloading methods.

Metered discharge

A hydraulic metering gate controls product flow from the trailer into a dirt remover, transfer conveyor or flume system.

No excavation

Truck Dumpers can be operational in a day if the customer-installed grade level concrete slab and main electrical supply are ready. The Truck Dumper is delivered pre-assembled including two hydraulic pumps with a full flow oil filter, motors, control panel, and protective cover for the hydraulic and electric systems.

Low maintenance

Rugged epoxy painted tubular steel construction eliminates distortion and provides safe, reliable service.

Easy access

Full length wheel rails help the driver to quickly position tractors with trailers up to 22 metres long.
